FEEDING GUIDELINES

MIXING RATE: 125g per litre of warm water. Feed 2.5 litres per calf twice daily or 5 litres once daily. After 4 weeks of age this quantity may be increased, for larger breeds, up to 6-7 litres per day.

NOTE: All calves require adequate colostrum intake and at all times, good shelter and access to clean water. Good quality hay and/or pasture should be available. Introduce Milligans Calf Cereal Mix at 7-10 days.

DECCOX ADDED
FEED ONLY TO CALVES
CONTAINS FREE FLOW AGENT

Milligans Calf Milk Replacer Quality Standards

Milligans NuStart Calf Milk Replacer is a premium quality milk replacer specially formulated for calves aged from day four. It is made from a nutritionally balanced blend of New Zealand milk and selected vitamins and minerals. **Milligans NuStart Calf Milk Replacer** also contains Deccox as an aid in the control of coccidiosis.

Milligans NuStart Calf Milk Replacer is easy to mix; it contains a free flow agent and is very soluble.

Milligans NuStart Calf Milk Replacer can be used in the traditional twice-a-day feeding system, or the higher concentration once-a-day system. For more information on feeding systems go to www.milligans.co.nz or phone 0800-STOCKFEED (0800 786 253).

Our Calf Milk Replacer is devised by leading New Zealand animal nutritionists using quality dairy ingredients to enable us to offer farmers a Premium product for their calves at competitive prices.

Quality product is valued highly by Milligans, and to stand behind this all products are regularly tested both internally and externally through recognised industry laboratories to ensure that we maintain the level of quality recognised with our products.

Ingredients: milk solids, dairy proteins, milk fats, feed supplements, mineral pre-mix, free flow agent, flavouring

The following are guidelines only, use common sense. If you are unsure whether this feed is suitable for your intended use or of the quantities to use please get advice from the retailer, vet or an informed source before use.

- To maintain this feed the packaging should be folded down or zip locked to prevent contamination and preserve freshness. Store in a cool, dry place - out of direct light.
- New born animals should be fed colostrum for the first four days after birth.
- All utensils and containers used in preparing and feeding must be kept clean.
- All feed changes should be gradual as overfeeding can cause digestive disorders.

Advised Practices

- Mix milk powder prior to feeding, i.e. not the day before, not only is there the potential for the milk to 'go off' but calves prefer the milk fresh and warm as energy will not be wasted in heating cold milk up to blood temperature.
- Mix powder thoroughly with warm water (preferably 38-40 degrees). Do not use water above 45-50 degrees as this will reduce the curding ability.
- Always use clean fresh water.
- Gradually increase feeding rates as this will avoid the potential for scours.

NuStart
For the start of a lifetime

NuStart is a unique premix developed for inclusion in calf milk replacers and quality calf weaner feeds. It is a natural blend of essential oils, plant extracts, Fructo-oligosaccharide,

Pre-Biotic, minerals and vitamins, designed to stimulate appetite, enhance gut development and inhibit the growth of non-desirable bacteria. It works by stimulating the digestion of fat and protein in milk, making more energy and amino acids available for calf growth. NuStart has also been shown to reduce growth checks at weaning, improve growth rates and feed conversion rates.
